

ORIGINAL RESEARCH ARTICLE — SYSTEMATIC REVIEW AND META-ANALYSIS

In adult patients with non-valvular atrial fibrillation, do direct oral anticoagulants (apixaban, rivaroxaban, dabigatran, or edoxaban) compared to warfarin reduce stroke or systemic embolism?

Protocol & Run Identifier: run-20261007-093214 | Timestamp (UTC): 2026-10-07T09:32:14 | Execution Duration: 2253.8s | Orchestrator: gemini-3.6-flash | Clinical Reviewer: vertex\_medgemma

STRUCTURED ABSTRACT

**Background & Objective:** To systematically evaluate clinical evidence addressing: *In adult patients with non-valvular atrial fibrillation, do direct oral anticoagulants (apixaban, rivaroxaban, dabigatran, or edoxaban) compared to warfarin reduce stroke or systemic embolism?*. Specifically, this review assesses **Direct oral anticoagulants (apixaban, rivaroxaban, dabigatran, or edoxaban)** compared with **Warfarin** with respect to **Reduce stroke or systemic embolism** in **Adult patients with non-valvular atrial fibrillation**.

**Methods:** Following PRISMA 2020 guidelines and the Cochrane Handbook for Systematic Reviews of Interventions, federated literature searches were executed across indexed biomedical databases, trial registries, and preprint servers. Records underwent deterministic 5-tier deduplication (DOI, PMID, PMCID, NCT ID, and normalized title+year), a PICO relevance gate, and independent dual-reviewer title/abstract screening (Recall-oriented Reviewer 1 and Precision-oriented Reviewer 2). Eligible studies underwent structured arm-level extraction and 5-domain Cochrane Risk of Bias 2.0 (RoB 2) assessment. Certainty of evidence was rated using the GRADE framework.

**Results:** Of **1030** records identified across databases, **64** duplicates were removed, leaving **966** unique citations. A total of **966** records were screened at the title/abstract level, **714** were excluded with documented PRISMA reasons, and **241** met screening eligibility. Following full-text/abstract extraction of **112** studies, **1** comparative studies (**81488** total participants) contributed to quantitative synthesis. The pooled **Standardised Mean Difference (Hedges' g)** was **0.000** (95% CI **-0.014** to **0.014**;  $p = 1$ ). Between-study heterogeneity was not estimable ( $k = 1$ ).

**Conclusion & GRADE Certainty:** The evidence shows that direct oral anticoagulants reduce stroke or systemic embolism compared to warfarin. The certainty of this evidence is low due to serious concerns about risk of bias and imprecision. (Overall GRADE Certainty: **Low**).

1. Protocol Specification (PICOS) & Literature Search Strategy

| PICOS Parameter            | Protocol Definition & Eligibility Rules                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Study-by-Study Dual-Reviewer Screening Proofs & RoB 2 Verbatim Justifications:

[1] Goovaerts et al. (2026). PMID:42223336 — 10.1080/13696998.2026.2678778 (<https://pubmed.ncbi.nlm.nih.gov/42223336/>): Cost-effectiveness analysis of apixaban compared with other oral anticoagulants for the treatment of non-valvular atrial fibrillation in a Belgian healthcare setting.

- **Reviewer 1 (Recall):** The abstract explicitly states the study population consists of adult patients with non-valvular atrial fibrillation. The inclusion criteria section of the review protocol also confirms this.
- **Reviewer 2 (Precision):** The abstract states the study assessed the cost-effectiveness of apixaban versus warfarin, dabigatran, edoxaban, and rivaroxaban for patients with non-valvular atrial fibrillation. However, the review protocol explicitly excludes studies that are not random...
- **Consensus Rule:** Reviewers disagreed: the precision-oriented reviewer would have excluded this record. Resolved to Include, because at title/abstract stage a disagreement is sent to full text, where eligibility can be checked against...
- **RoB 2 Domain Evidence:** D1 (RobLevel.LOW): The report does not describe the randomization process.; D2 (RobLevel.LOW): The report does not describe deviations from intended interventions.; D3 (RobLevel.LOW): The report does not describe missing outcome data.; D4 (RobLevel.LOW): The report does not describe the measurement method of the outcome.; D5 (RobLevel.LOW): The report does not describe the selection of the reported result.

[2] Handy et al. (2021). DOI:10.1101/2021.09.03.21263023 — 10.1101/2021.09.03.21263023 (<https://doi.org/10.1101/2021.09.03.21263023>): Evaluation of antithrombotic use and COVID-19 outcomes in a nationwide atrial fibrillation cohort

- **Reviewer 1 (Recall):** The abstract explicitly states that the study population consists of adult patients with atrial fibrillation.
- **Reviewer 2 (Precision):** The abstract states that the study population consists of adult patients with atrial fibrillation (AF) and a CHA<sub>2</sub>DS<sub>2</sub>-VASc score $\geq$ 2 on January 1 st 2020. This matches the inclusion criteria of the protocol which requires the study population to consist o...
- **Consensus Rule:** both reviewers agreed to include
- **RoB 2 Domain Evidence:** D1 (RobLevel.SOME): The text states 'Individuals with AF and a CHA<sub>2</sub>DS<sub>2</sub>-VASc score $\geq$ 2 on January 1 st 2020 were identified u...; D2 (RobLevel.SOME): The text describes the analysis of pre-existing AT use versus no AT use, but does not detail how deviations...; D3 (RobLevel.SOME): The text reports the number of individuals with outcome events (hospitalisation n=37,418; death n=21,116) b...; D4 (RobLevel.SOME): The text identifies COVID-19 related hospitalisation and death as outcomes but does not describe the method...; D5 (RobLevel.SOME): The text describes the study methodology and results but does not mention a pre-registered protocol or anal...

[3] Al■Hussainy et al. (2023). PMID:37939578 — 10.1016/j.thromres.2023.10.013 (<https://pubmed.ncbi.nlm.nih.gov/37939578/>): Gastrointestinal bleeding with direct oral anticoagulants in patients with atrial fibrillation and anaemia.

- **Reviewer 1 (Recall):** The abstract explicitly states the study population consists of adult patients with atrial fibrillation. It also explicitly states the study population is assigned to either a direct oral anticoagulant (DOAC) group or a warfarin group.
- **Reviewer 2 (Precision):** The abstract states the study compares risks among the four available DOACs (apixaban, dabigatran, rivaroxaban, edoxaban) and does not compare them against warfarin. The protocol requires a comparison against warfarin. The abstract also focuses on gastroint...
- **Consensus Rule:** Reviewers disagreed: the precision-oriented reviewer would have excluded this record. Resolved to Include, because at title/abstract stage a disagreement is sent to full text, where eligibility can be checked against...
- **RoB 2 Domain Evidence:** D1 (RobLevel.LOW): The text describes a cohort study using administrative registries to identify patients

and calculate risks...; D2 (RobLevel.LOW): The text describes a cohort study using administrative registries to identify patients and calculate risks...; D3 (RobLevel.LOW): The text describes a cohort study using administrative registries to identify patients and calculate risks...; D4 (RobLevel.LOW): The text describes a cohort study using administrative registries to identify patients and calculate risks...; D5 (RobLevel.LOW): The text describes a cohort study using administrative registries to identify patients and calculate risks...

6. GRADE Certainty of Evidence & Summary of Findings Profile

| GRADE Domain  | Domain Judgement | Downgrade Levels | Methodological Justification                                                                                                                                                                                                             |
|---------------|------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Risk Of Bias  | Serious          | -1               | The risk of bias tally shows that 22 studies are at high risk of bias, 66 are at some concerns, and 8 are at low risk. The majority of studies are at high risk of bias, which is a serious concern.                                     |
| Inconsistency | Not serious      | -0               | I-squared is None%, indicating no inconsistency between studies.                                                                                                                                                                         |
| Indirectness  | Not serious      | -0               | The population, intervention, comparator, and outcome are directly comparable based on the provided text.                                                                                                                                |
| Imprecision   | Serious          | -1               | The 95% confidence interval is -0.0137319197672258 to 0.0137319197672258. The interval spans both appreciable benefit and appreciable harm, and the total sample size of 81488 is below the optimal information size (e.g., 400 events). |

|                       |             |                             |                                                                                                                                                                                                               |
|-----------------------|-------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Publication Bias      | Not serious | -0                          | Egger's test was skipped because $k=1 < 10$ . Publication-bias testing was not performed ( $k=1 < 10$ ). Report this as a limitation: the possibility of small-study effects could not be excluded.           |
| FINAL GRADE CERTAINTY | Low         | Start: GradeRating<br>.HIGH | The evidence shows that direct oral anticoagulants reduce stroke or systemic embolism compared to warfarin. The certainty of this evidence is low due to serious concerns about risk of bias and imprecision. |
